EDUCATION

Purdue University

B.S. in Computer Science

Dec 2024

West Lafayette, IN

Relevant Coursework: Operating Systems, Computer Networks, Database Systems, Cloud Computing

TECHNICAL SKILLS

Languages: Python, Go, TypeScript, Node.js, Java, C, C++, SQL, Hack

Developer Tools: Git, Unix/Linux, Docker, Kubernetes, Helm, Terraform, GitHub Actions, Azure DevOps, PyTest

Cloud: AWS (Developer Associate), Azure, GCP

AI & MLOps: FastAPI, LangChain, scikit-learn, Vector Search, Vector Databases, Evaluation/Benchmarking

EXPERIENCE

Meta | *Production Engineer*

Sep 2025 – Present

- Owned the investigation that root-caused recurring database-throttling SEVs (~5–6 per 6-month cycle, ~30–40 unactioned alerts) to cross-team callers reusing shared functions and exhausting the owning team's QPS budget.
- Instrumented per-callsite QPS observability on a distributed database tier powering an ads platform via 70%/90% threshold detectors and method-signature attribution.
- Designed and drove the rollout of a callsite-forking remediation that segments ownership and isolates traffic per caller.
- Built an applied ML pipeline using Llama 3.3 (8B) for structured summarization, embedding generation, and cosine similarity clustering, grouping **8,000+ SEV follow-up tasks** into actionable clusters to enable batch resolution. Iterated across multiple clustering approaches with stakeholders to converge on the production strategy.
- Executed a subdomain migration from the shared global web tenant to a dedicated tenant for a platform serving **1000s of DAU** (primarily businesses); cut p95 latency **57%** and shrank fault-isolation domain.

Geico | *Software Engineer*

Jan 2025 – Sep 2025

- Authored Python AWS Lambda services that normalize contact events, batch-write to DynamoDB, and fan-out via EventBridge with DLQs and exponential backoff.
- Processed **500–700K events/day** at ~90% PyTest coverage on least-privilege Terraform modules.
- Rolled out Amazon Connect queue observability across **800+ queues** with SNS + Slack alerting.
- Reduced batch metrics latency **12x** (120s → 10s) via request coalescing and concurrent SDK fan-out.

Geico | *Software Engineering Intern*

Jun 2024 – Aug 2024

- Deployed JupyterHub on Azure Kubernetes Service (AKS) with Azure AD SSO/RBAC and Spark/ADLS connectivity; enabled a lake-first analytics workflow that contributed to a **~25% reduction** in team Snowflake spend.

Texas Instruments | *Software Engineering Intern*

May 2023 – Aug 2023

- Engineered an Oracle APEX + PL/SQL internal tool; replaced a **4–6 hour** manual lookup with a **~5-second** self-serve flow used daily by licensing ops across 250+ products.

PROJECTS

Local Paste Service | *Go, SQLite, launchd*

[repo link](#)

- Developed a zero-dependency Go pastebin (20MB binary) backed by SQLite WAL for concurrent local storage, featuring CLI integration and automatic TTL expiration via background garbage collection.

LinkedIn Interview Agent | *FastAPI, React, GPT-4o, FAISS*

[repo link](#)

- Designed an agentic RAG interview platform with JD + resume ingestion, FAISS-backed semantic skill mapping, and adaptive question generation conditioned on candidate gaps; instrumented p50/p95 latency and \$/session tracking (Q-generation **~2s p95**).
